# What's the Real World Problem?

- The observations in different categories can be **imbalanced**.
- The **cost** of false negative prediction and that of false positive prediction could be different
- Even we know the cost ratio of the two kinds of false prediction, it could be **dynamic** through the time.
- That means the conventional accuracy fail to give satisfying evaluation for the models

# Correlation Heat Map

# Table of Contents

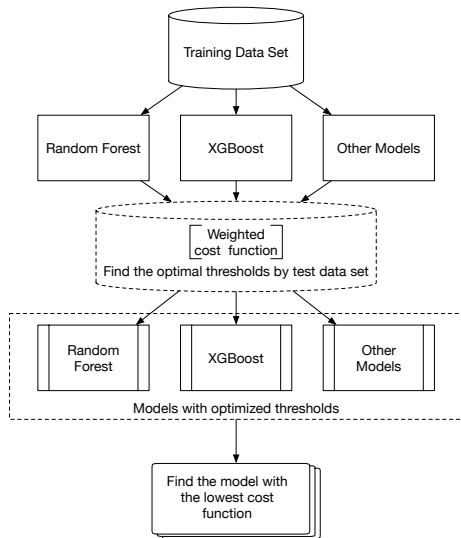

- 1 Introduction to the Problem
- 2 Methodology Design**
- 3 Model Comparison
- 4 Summary and Further Discussion

# The model selection algorithm

- Every model gives a response probability instead of a class so we can adjust the threshold.
- The weighted cost function for any classifier  $\Theta$ .

$$L(\Theta) = \alpha \times FP + \beta \times FN$$

- Find the model with the lowest cost function.

# Table of Contents

- 1 Introduction to the Problem
- 2 Methodology Design
- 3 Model Comparison**
- 4 Summary and Further Discussion

# Logistic Regression

threshold at 0.01 – cost of FP = 1, cost of FN = 50  
total cost = 1298

# Naive Bayes

threshold at 0.99 – cost of FP = 1, cost of FN = 10  
total cost = 2760

# Random Forest: ntree = 200

## The importance map.

# Random Forest: ntree = 200

## The curves and confusion matrix

threshold at 0.05 – cost of FP = 1, cost of FN = 50  
total cost = 1314

# Boosting

- Parameters adopted within each type of method:
  - Gradient boosting & Ada Boosting: # Trees = (500, 1000, 1500, 2000)
  - Depth: 3 and 7 (eXtreme gradient boosting)
- The best model selected: Extreme Gradient Boosting with depth = 3

| threshold | tpr       | fpr       | tp  | fp    | tn    | fn | cost        |
|-----------|-----------|-----------|-----|-------|-------|----|-------------|
| 0.0000000 | 1.0000000 | 1.0000000 | 146 | 85296 | 0     | 0  | 85296.00000 |

# Boosting: Corresponding Curves

The best model Selected: eXtreme gradient boosting with depth = 3.

threshold at 0.05 – cost of FP = 1, cost of FN = 50  
total cost = 1126

# Model Comparison

# Table of Contents

- 1 Introduction to the Problem
- 2 Methodology Design
- 3 Model Comparison
- 4 Summary and Further Discussion

# Summary

- Models for extremely imbalanced data can not be directly evaluated by accuracy.
- XGBoosting and Logistic regression perform well.
- Advantages of our solution.
  - Utilizing flexible weighted cost function.
  - Only need to train one time.
- Disadvantages.
  - Binary classifiers are not suitable for this methodology.
  - The methodology does not improve the performance from data transformation.
- Further improvement.
  - One can try oversampling or undersampling to improve.
  - Cross validation can be implemented to prevent overfitting.
